

Cellar Automation: Temperature Control

Robert Fulwiler
Quality Manager
Fremont Brewing

District Northwest

October 2017,
Eugene, Oregon

Fremont Brewing

- Started brewing in 2009
- Operate two facilities- a production brewery (90-240bbl batches) and a small-batch brewery (10-30bbls).
- On pace to produce 42,000bbls in 2017

District Northwest

October 20, 21, 2017
Eugene, OR

Small Batch Facility

- Five 15bbl FVs
- One 30bbl FV
- Isolated Temp Controllers (SOLO)

District Northwest

October 20, 21, 2017
Eugene, OR

Production Facility

Large Facility:

- Five 240bbl FVs
- Seven 90bbl FVs
- Two 60bbl FVs
- PLC Controlled
- Integrated into SCADA

District Northwest

October 20, 21, 2017
Eugene, OR

Overview

- Automation basics
- Components of an Automated Control System
- Basic Control Loop
- Fermentation Control System
- Fermentor Cooling Mechanics

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Automation

- The technology by which a process or procedure is performed without human assistance.
- **Simple Example:** ON/OFF fermentation temperature control

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Automation

- The technology by which a process or procedure is performed without human assistance.
- **Complex:** Packaging Equipment- can filler, carton packer, robots!

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Why Brewery Automation?

- Consistency (Quality!)
- Resource and Labor Efficiency
- Automated Data-logging
- Troubleshooting
- Safety

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

- Controller (CPU)
- Inputs
- Outputs
- HMI (Human Machine Interface)
- SCADA (Supervisory Control and Data Acquisition)

UNITED WE BREW.

October 20, 21, 2017
Eugene, OR

District Northwest

Control System Components

Controller

- Reads raw electric signal (i.e. temperature sensor)
- Converts inputs to human readable (degrees F)
- Stores program:
 - Set points
 - Dead Band
- Engages outputs (glycol valve)

UNITED WE BREW.

October 20, 21, 2017
Eugene, OR

District Northwest

Control System Components

Controller

- Programmable Logic Controller (PLC)
 - More “advanced” customizable controller
 - Generally can connect to monitoring system for datalogging and/or alarming
 - User Programmable by **ladder logic**.

UNITED WE BREW.

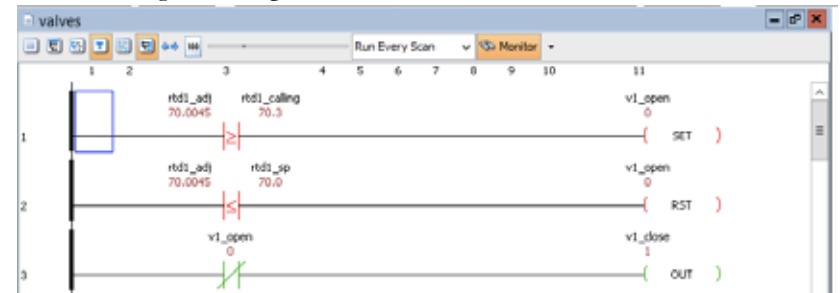

October 20, 21, 2017
Eugene, OR

October 20, 21, 2017
Eugene, OR

District Northwest

Control System Components

Types of Inputs

- **Digital (ON/OFF)**
 - Controller either receives an electric signal input or it doesn't.
 - Proximity Sensors

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Digital (ON/OFF)**
- “Lidless Can” Sensor

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Digital (ON/OFF)**
- Can detection “photo-eyes”

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Digital (ON/OFF)**
- Butterfly valve feedback sensor (proximity switch)

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Analog**
 - Sends a ranged input: 4-20mA, 0-10V, Voltage Pulse, RTD.
 - Translated into a precise value.
 - *Example:* A pressure transducer may be calibrated to send 4-20mA signal between 0-16psi. Therefore, 1mA = 1psi
 - 12.59mA reading = 8.59psi.

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Analog**
- Electromagnetic Flow meter
- Outputs high frequency pulse for totalizer, ie. 10pulses per gallon.
PLC translates to flow rate

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Inputs

- **Analog**
- RTD temperature sensor

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Outputs

- **Digital (ON/OFF)**
 - *Example:* Solenoid valve, Butterfly valve, Alarm light

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Outputs

- **Analog**
 - signal sent to VFD to control pump speed, lauter rake speed, flow control valves

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Types of Outputs

- **Analog**
 - Some valves operate on **analog** output from PLC- i.e. double seat flow control valves

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control System Components

Human Machine Interface (HMI)

- Simple:

Control Loop Basics

Process Control is done in a continuous “Loop”

- **Goal of Loop:** control tank temperature

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control Loop Basics

Process Control is done in a continuous “Loop”

- Loop receives **Input** or **Process Value (PV)** from sensor
- i.e. Current tank temperature from **RTD**

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control Loop Basics

Process Control is done in a continuous “Loop”

- Controller is given a **Set Point (SP)** to control this input.
- “**Process**” is some change to system- i.e. yeast heating up beer
- If **PV** is above **SP**, controller takes action to control process (open glycol valve)

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control Loop Basics

Process Control is done in a continuous “Loop”

- Once **PV** has fallen below **SP**, controller turns off valve to keep temperature at **SP**

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Control Loop Basics

Dead Band

- Controller has parameter for how far **PV** should get above **SP** before taking action. This is called “**dead band**”
- Signal is not perfectly constant, differential avoid rapid fire valve opening and closing when **PV** is very close to **SP**

More Advanced Control

At Fremont, ON/OFF keeps tank temp within $\pm 0.5^\circ\text{F}$. Can we do better? (Do we need to?)

“Time Proportional”

- Instead of simple ON/OFF, ladder logic is slightly more complicated.
- The further away from the setpoint the longer the valve stays open. If **SP** is 70 and **PV** is 70.2, glycol might switch on for 20 seconds and then off again. If **PV** climbs to 70.5, glycol could switch on for two minutes then off again.
- Less overshooting temp because of **deadband** and undershooting past setpoint (wasted cooling energy and possibly going to a lower temp than you is desired)

District Northwest

Temperature Sensor Types

Thermocouple (TC)

Principle:

- Two types of metal joined together create a tiny voltage which varies with temperature.
- Voltage is read by controller
- “Self powered”

District Northwest

UNITED WE BREW.

October 20, 21, 2017
Eugene, OR

Temperature Sensor Types

Thermocouple (TC)

Advantages:

- Cheaper
- Faster Response Time
- High range (as high as 3000 degrees)

Disadvantages:

- Less accurate (+/- 1F)

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Temperature Sensor Types

Resistance Temperature Detector (RTD)

Principle:

- $V \text{ (Voltage)} = I \text{ (Current)} * R \text{ (Resistance)}$
- As temperature increases, **resistance increases linearly.**
- By passing current through circuit and measuring voltage, resistance can be calculated
- Single type of metal (Platinum has best “linear” property).
- Requires power source

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Temperature Sensor Types

Resistance Temperature Detector (RTD)

Advantages:

- More accurate (+/- 0.1F)
- Robust signal (less prone to electrical interference)

Disadvantages:

- More expensive
- Lower range (max 600F)
- Slower response time

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Glycol Valve Types

Solenoid Valve

Advantages:

- Cheaper

Disadvantages:

- Less **flow** for same size valve than ball valve
- More prone to sticking/failure
- ”Water Hammer”

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Glycol Valve Types

Actuated Ball Valve

Advantages:

- Higher flow rate
- Longer cycle times (ie 10 second open)- helps with hammer
- Less prone to failure

Disadvantages:

- Cost

UNITED WE BREW.

Fermentation

Wort Sugar =>

Ethanol + Carbon Dioxide +
HEAT

- Temperature control is a critical fermentation parameter to control.
- If unchecked, high temperatures lead to off-flavors, yeast management issues

UNITED WE BREW.

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

Figure 3: Attenuation regimes in CCTs.

Brewer and Distiller International August 2015 | 21

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

• Active Phase

- Lots of heat generated
- Fermenting wort is cooled by **conduction** (heat transferred from wort through jacket to glycol)
- Tank jackets only efficiently cool wort by **convection** currents. Cooled wort is more dense which falls down the sides of tank
- This pulls wort up the center of the tank. Currents are aided by yeast activity (CO₂ evolution)
- Because of level of wort movement, its possible to only use top jacket during active phase

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

• Final Gravity / Yeast Management

- At the end of fermentation yeast will flocculate to the bottom of the tank
- Yeast is a good insulator. Heat can build up in the yeast pack at the bottom of the tank and be as much as **10degrees** warmer than the beer.
- A separate cooling loop can be used to control just the yeast temperature by using cone jacket and cone RTD

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

• Crash Cooling

- All jackets are utilized to bring temperature down as quickly as possible.
- **Convection** currents help cycle wort past past jackets to cool entire tank down.
- **Convection** continues to happen until **Inversion Point**

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

• Inversion Point

- The temperature at which the beer will be **most dense**. Below this, beer actually becomes **less dense**.
- Approx 34-35F for “normal” ~5%ABV beers but will be **lower** for beers with higher ABV or higher residual sugar
- **Convection currents** stop while moving through this point
- Pump mixing or gas rousing can help speed up cooling

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

- Inversion Point

- Once tank is past inversion point, convection currents **reverse**. Coldest beer **rises** up the sides of the tank, pulling beer **down** the middle
- After fully crashing to 29-30F, coldest beer will be at the **top** of the tank

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Fermentation Temperature Control

- Transfer

- Once beer has conditioned at ~30F for set amount of time, it is ready to transfer, carbonate, and enjoy!

UNITED WE BREW.

District Northwest

October 20, 21, 2017
Eugene, OR

Conclusion

- Temp Control is one of the simplest automated tasks that every brewery uses
- Accurate temperature control is critical for making consistently delicious beer. A failure of this system can lead to ruined batches
- For relatively low cost, your cellar control system can be upgraded to be able to alert you of failures or even if your fermentations are running out of spec- check out Brian's **Raspberry Pi** project!
